

Questions to ask your doctor about tissue-agnostic therapy for rare cancers

If you are considering whether or not a tissue-agnostic therapy is right for you, you should ask your care team questions about what to expect. Possible questions may include:

- Do the results of my biomarker testing show any genetic alterations that can be targeted by an existing tissue-agnostic therapy?
 - If so, how would taking this tissue-agnostic therapy compare to not receiving treatment or taking a different drug or treatment?
- What are the expected side effects of this tissue-agnostic therapy?
- How long will I receive this therapy? Where will I need to go to get this therapy? What is the dosing frequency?
- How will this therapy be given (e.g., pill, injection, infusion)?
- How will I know if the therapy is working?
- What are the names of the drug(s) I will be taking?
- How do I find out if my insurance covers tissue-agnostic therapies?
- Have you treated other patients with tissue-agnostic therapies?
 - If so, what kinds of results have you seen?
 - If not, can you recommend a provider who has experience with these types of therapies?
